

Patient ID: 00  
Patient Name: UNO-DOG (SUMAGIT)  
Requesting MD: N/A  
Sending Clinic: #HPD BAGUIO  
Clinical Data:  
Specimen: Skin, back area  
Collection Date: 10/30/2021  
Procedure: Mass removal

Lab Number: 2136022558  
Age: 4  
Sex: M  
Date Ordered: 11/05/2021  
Specimen Received: 11/07/2021  
Date Reported: 11/22/2021  
No. of Slides: 1  
No. of Cassettes: 1

### **SURGICAL PATHOLOGY REPORT**

DIAGNOSIS: Skin: Dermoid cysts.

---

#### **Gross Description:**

The specimen is received in formalin fixative with the patient's name and is labeled as "SKIN (BACK AREA)". The specimen consists of a nodule with underlying skin and subcutaneous tissue entirely measuring 2.0 x 2.0 x 1.2 cm. The superficial, cream white to light brown, verruciform nodule measures 1.5 x 1.2 x 0.5 cm and is seen at least 0.5 cm from the deep margin and 0.3 cm from the nearest peripheral margin. Cut sections show a cream white, variegated cut surface. Surgical margin inked black. The entire specimen is taken for study.

#### **Microscopic Description**

Within cut borders are 3 medium to large cysts lined by disorganized stratified squamous epithelium with sprinkling of keratohyaline granules. The cysts lumina are filled with keratin materials admixed with cellular debris. The cysts are surrounded by a thin rim of collagen bundles that tended to run parallel to the cyst walls. Localized aggregates of inflammatory cells predominantly neutrophils close to the cysts.
